## POTENTIAL FOR FORMATION OF DISINFECTION BY-PRODUCTS FROM STORAGE OF CHLORINATED SURFACE WATER IN THE BASALT AQUIFER NEAR FALLON, NEVADA: USGS SCIENTIFIC INVESTIGATIONS REPORT 2005-5142 (PAPERBACK)

To download **Potential for Formation of Disinfection By-Products from Storage of Chlorinated Surface Water in the Basalt Aquifer Near Fallon, Nevada: Usgs Scientific Investigations Report 2005-5142 (Paperback)** eBook, remember to follow the web link below and download the file or gain access to other information which are have conjunction with POTENTIAL FOR FORMATION OF DISINFECTION BY-PRODUCTS FROM STORAGE OF CHLORINATED SURFACE WATER IN THE BASALT AQUIFER NEAR FALLON, NEVADA: USGS SCIENTIFIC INVESTIGATIONS REPORT 2005-5142 (PAPERBACK) ebook.

Bibliogov, United States, 2013. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.Increased pumpage from a basalt aquifer near Fallon, Nevada, has caused its water levels to decline and has induced changes in the quality of water pumped from the basalt. The aquifer is the sole source of water for municipal supply to the city of Fallon, the Naval Air Station Fallon, and the Fallon Paiute-Shoshone Tribe. These changes may be mitigated by storage of surface water in the basalt for subsequent use. Because chlorination of the surface water may be required for storage, the U.S. Geological Survey, in cooperation with the Fallon Paiute-Shoshone Tribe, made laboratory tests using laboratory carbon-organic-free water, surface-water, ground-water, and basaltic-rock samples to determine the potential for formation of disinfection by-products. Experiments with water samples only (no rock and no chlorine) indicated no change in dissolved-organic-carbon (DOC) concentrations over a 20-day reaction period; whereas, all experiments using rock, water, and no chlorine indicated an increase in DOC concentrations. The greatest increase in DOC concentrations for all three water samples occurred in experiments with the rock samples from outcrops on Rattlesnake Hill. Experiments with water only and chlorine yielded a total trihalomethane (THM) concentration of 97.4 µg/L for the ground-water sample and 347 µg/L for the surface-water sample. Experiments with mixtures of water, rocks, and chlorine indicated that reactions with the rock consumed chlorine and released significant amounts of organic carbon from the rock, increasing the DOC concentration in the water. The organic carbon in the rocks likely is associated with the secondary clay minerals that line vesicles and fractures in the rocks. THM concentrations were greatest, from 335 to 909 µg/L, for surface water equilibrated with rock samples from Rattlesnake Hill. However, the concentration of...
