Excerpt: . agree with these in being soft, light, and combustible on water. Yet in some things they do agree quite closely. For example: Potassium forms the oxide  $K_2O$  Copper  $Cu_2O$  Silver  $Ag_2O$  In these compounds the atoms of potassium, copper, and silver hold the same relation to oxygen. And the order of their atomic weights brings them together in the same group in the spiral. The Vacant Places.-- There are many vacant places in the spiral: what is the meaning of these gaps? They lead us to think that the elements are not yet all discovered. When the table was first made there was a vacant place where gallium, Ga, now stands in the third group. Mendelejeff said that there ought to be an element whose atomic weight is about 69, its specific gravity about 6, and its atomic volume about 11.5, to fill this gap. Afterward gallium was discovered. Its atomic weight proved to be 69.8, its specific gravity 5.9, and its atomic volume 11.8. From its vacant place in the table, Mendelejeff was able to give the properties of this metal before it had been discovered. He did the same thing for the element scandium, Sc, also in the third group. Possibly other elements are yet to be discovered by which other gaps will be filled. the analytical system. Classification Founded on Solubility.--We have found that hydrochloric acid will give a precipitate if mixed with a solution of a compound of silver, Ex....
