The growth of the wheat seedlings in the soils increased the oxidative power. It was probably not possible, however, to separate the soil absolutely from the root debris and the increased oxidizing power of the planted soil may come partly from the oxidizing power of the root cells contained therein or from the oxidizing enzymes left in the soil during the growth of the root. That the increased oxidation in the planted soil is due to the oxidizing powers of the root debris may be seen in the fact that in the planted soils as in the case of oxidation by the intact root, the oxidation is somewhat gradual, being greater five hours after shaking with aloin than in two hours after shaking,...
